                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                        The invention provides immunoglobulin E (IgE) antagonists comprising one or more of the FcepsilonRI receptor-binding determinant sites of human IgE. The antagonists include IgE variants comprising an immunoglobulin template and binding determinant sequences (Dds) CDDds, EFbds and the sequence shown in AAY42581. The CDbds (CD loop binding determinant sequences are selected from the sequences shown in AAY42567-Y4257 and the EFbds (EF loop binding determinant sequences shown in AAY42578-Y4280. The variants are useful in raising and screening anti-IgE antibodies, in the isolation and purification of FerensilonRI receptor and in the treatment and prophylaxis of allergic

                                                                                                                                                     cell activating and immunosuppressive activity, and is used to treat transplant patients to prevent rejection. The antibody can be engineered to contain a human Fc region. By transferring the binding specificity into a human framework, the immunosalicity is reduced without affecting the immunosuppressive activity. (Updated on 25-MAR-2003 to correct PN

heavy chain (VH) is derived from a murine source and the sequences encoding CHL, CH2 and CH3 are derived from a human source. This vector, in combination with the chimeric light chain vector, pAG4611 (see also AAQ43845), was transfected into Sp2/0 cells and clones were isolated. 128.1 is an anti-human transferrin receptor antibody which binds to the transferrin receptor on brain capillary endothelial cells. This antibody may be used in a conjugate in which it is linked to a neuropharmaceutical or diagnostic agent. The conjugate may be used to treat or prevent meurological disorders egg. brain tumours, AIDS, stroke, spilepsy, Parkinsons and Alzheimers disease. It may also be used for diagnostic methods. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a modified immunoglobulin (IgG1) which comprises an IgG constant domain having at least one amino acid modification. The immunoglobulins are used in the treatment or prevention of a disease or disorder by passive immunotherapy for vaccinating a subject and for in vivo diagnosis of a subject. The disease and disorders include a gamma globulinaemia, hypogammaglobulinaemia, autoimmune diseases, graft-versushost, lymphoid malignancies and passive immunotherapies and also for the

The variant mediates antibody-dependent cell-mediated cytotoxicity (ADCC) in the presence of effector cells more effectively than the parent polypeptide and comprises at least one amino acid modification at position 280 in the Fc region. The composition is useful in treating disease e.g.,
                                                                                                              63
                                                                                                                                                                    64
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                63

parent polypeptide having at least a portion of a Fc region. The variant mediates antibody-dependent cell-mediated cytotoxicity (ADCC) in the presence of effector cells more effectively than the parent polypeptide and comprises at least one amino acid modification at position 280 in the Fc region. The composition is useful in treating diseases e.g., autoimmune diseases. The present sequence represents a CH2 region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New composition comprising a variant of a parent polypeptide having at least a portion of a Fe region, useful in treating e.g., autoimmune

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ద
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to a method for generating an immune response to an antigen in a patient. The method comprises administering to the patient an immunoglobulin (Ig) or its portion where the Ig has at least one peptide epitope of the antigen attached to the Ig or its portion and administering the immunoglobulin or its portion in conjunction with a RNA segment. A recombinant human Ig molecule capable of binding to an RC gamma receptor (RogammaR) of an antigen presenting cell (APC) was used to illustrate the invention. The recombinant human Ig molecule comprises a CH3 region (ADL90102), a CH2 region (ADL90103), a hinge region (ADL90104) and a flanking peptide (ADL90105).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                having
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Generating an immune response to an antigen, useful for generating desired T cell responses comprises administering an immunoglobulin one peptide epitope of the antigen attached to the immunoglobulin.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

C;Complex: An immunoglobulin heterotetramer subunit consists of two identical light (kap hain disulfide bonds. In some cases, such as IgA and IgM, the subunits associate into la C;Superfamily: immunoglobulin C region; immunoglobulin homology
                                                                                                                                                                                                                                                                                                                                              ų.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ж

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

"Primary structure of the L chain from a rabbit homogeneous antibody
to streptococcal carbohydrate. II. Sequence determination of peptides
from tryptic and peptic digests.";
J. Biol. Chem. 250:3289-3296(1975).
-!- MISCELLANBOUS: This chain was obtained from antibody to the
specific carbohydrate of group C Streptococci and was isolated
from the serum of a single rabbit.
-!- SIMILARITY: Contains 1 immunoglobulin-like domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              MEDLINE-83300036; PubMed-6412231;

"A genomic gene encoding the b5 rabbit immunoglobulin kappa constant region: implications for latent allotype phenomenon.";
Proc. Natl. Acad. Sci. U.S.A. 81:1789-1793 (1984).
-!- MISCELLANBOUS: The CDNA from which this sequence was derived contains a terminator codon within the V-region coding region. The origin of this codon and of the differences between this and other sequenced b5 C regions are unclear. The cDNA clone was made using mRNA from trypanosome-infected b5-homozygous rabbits.

"Multiplicity of constant kappa light chain genes in the rabbit genome: a b4b4 homozygous rabbit contains a kappa-bas gene.";
genome: a b4b4 homozygous rabbit contains a kappa-bas gene.";
-1- MISCELLANEOUS: In Basilea rabbits, the major type of light chain is lambad. The kappa chain shown is a minor component. All other rabbit B allotyges have Cys-64.
-1- SIMILARITY: Contains 1 immunoglobulin-like domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          44; Indels 12; Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 36, Application US/09281760E

Patent No. 6734287

GENERAL INOFMATION:

APPLICANT: Lawton, Robert

APPLICANT: Francoeur, Greg

TITLE OF INVENTION: Specific Binding Protein for Treating

TITLE OF INVENTION: Canine Allergy

FILE REFERENCE: 01-1275A

CURRENT APPLICATION NUMBER: US/09/281,760E

CURRENT FILING DATE: 1999-03-30

PRIOR APPLICATION UNMBER: 09/058,331

PRIOR FILING DATE: 1998-04-09
                                                                                                                                                                                                                                                                                                                                                                    OPERALIUS SYSIEM: KC-LUCS/MS-LUCS
SOFTWARE: PACENTIN Release #1.0, Version #1.25 (EPO)

New chimeric anti-Vascular Adhesion Protein-1 monoclonal antibodies and encoding nucleic acid molecules, useful for diagnosing and treating chronic inflammatory disorders, e.g. rheumatoid arthritis or psoriasis.

Claim 18; SEQ ID NO 16; 56pp; English.

This sequence represents the constant region of a human anti-Vascular Adhesion Protein-1 (VAP-1) antibody heavy chain. This sequence may be used in the production of a chimeric mouse-human anti-VAP-1 antibody. The nucleic acid molecules, polypeptides or antibodies are useful in treating VAP-1 mediated inflammatory disorders, such as rheumatoid arthritis, inflammatory bowel disease, autoimmune diseases or psoriasis. The chimeric VAP-1 antibody is further used for in vitro and in vivo chimeric applications, including in vivo immunoscintigraphic imaging of inflammation sites. The chimeric MAD's of the invention have improved kinetic properties compared to the corresponding murine antibodies.

The invention relates to a novel anti-nerve growth factor (NGF) antibody which binds NGF with a KD of less than about 2 nM and inhibits human NGF-dependent survival of mouse E13.5 trigeminal neurones with an ICSO of about 100 or 10 pM or less, where the ICSO is measured in the presence of emonstrates analgesize and immunomodulator activities and may be useful commonstrates analgesize and immunomodulator activities and may be useful for preventing analgesize in immunomodulator activities and may be useful for preventing and/or treating pain, including post-surgical pain and pain associated with rheumatoid arthritis or osteoarthritis. The antibody may be further utilised for treating inflammancory cachexia associated current sequence is that of the humanised anti-NGF antibody E3 heavy chain full-length protein of the invention which was synthesised via gratting CDRs (complementarity determining regions) from murine anti-NGF mab (monoclonal antibody) 911 onto human framework sequences and subsequently mutating the CDRs to improve binding.
                                                                                                                                New anti-nerve growth factor antibodies for preventing or treating pain, including post-surgical pain, rheumatoid arthritis pain or osteoarthritis pain, or for treating inflammatory cachexia associated with rheumatoid

                                                                                                                   This sequence represents a chimeric human-mouse anti-Vascular Adhesion Protein-1 (VAP-1) antibody heavy chain. This sequence may be used in the production of a chimeric mouse-human anti-VAP-1 antibody. The nucleic acid molecules, polypeptides or antibodies are useful in treating VAP-1 mediated inflammatory disorders, such as rheumatoid arthritis, inflammatory bowel disease, autoimmune diseases or psoriasis. The chimeric VAP-1 antibody is further used for in vitro and in vivo diagnostic applications, including in vivo immunoscinitigraphic imaging of inflammation sites. The chimeric WAP's of the invention have improved kinetic properties compared to the corresponding murine antibodies.
                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                               New chimeric anti-Vascular Adhesion Protein-1 monoclonal antibodies and encoding nucleic acid molecules, useful for diagnosing and treating chronic inflammatory disorders, e.g. rheumatoid arthritis or psoriasis.

The invention relates to a recombinant human erythropoietin (HuEPO)-L-vFC fusion protein comprising HuBPO, a peptide linker, and a human comprising HuBPO, a peptide linker, and a human community of fragment crystallisation region) variant. Also included is a carbohydrate-derived cell line producing the human crospinal protein exhibits an enhanced in vitro biological activity of at least 2-fold relative to that of recombinant HuBPO on a molar of at least 2-fold relative to that of recombinant HuBPO on a molar of at least 2-fold relative to that of recombinant HuBPO on a molar of acids is present between HuBPO and the human IGG FC variant comprises a hinge, CH2 and CH3 domains of human IGG FC contains amino acid mutations to attenuate effector functions. The human CG TG FC variant comprises a hinge, CH2 and CH3 domains of human IGG with Pro3131ser mutation, human IGG with Ser228Pro and Leu233Ala mutations, or human IGG1 with chronic anaemia caused by renal failure, cancer crecombinant human erythropoietin-L-vFC fusion proteins are useful for treating patients with chronic anaemia caused by renal failure, cancer chemotherapy, rheumatoid arthritis, azathioprine treatment for H1V creating patients with chronic anaemia caused activity and prolonged presence of the human erythropoietin-L-vFC fusion protein in the serum, as compared to prior art, leads to lower dosages and less frequent injections result in better patient compliance and quality of life. The present sequence represents the fusion protein HuBPO-L-vFGgamma2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      9

CHERON, a peptide linker, and a human 1gG FC variant, is new.
INDEPRINERY CLAIMS are also included for the following: a chinese hammeer of CHERO), a peptide linker, and a human 1gG FC variant, to have fusion protein in its growth medium in access of 10 Emicro; g per million cells in a 24 hour period; and a method for making a recombinant thrisin protein comprising the Protein.

CC Gravid, and a method for making a recombinant thrisin protein comprising the Protein. The peptide linker containing 20 or fewer amino acids selected from glycine, serine, alanies and threomine. The between Hubbo and the human 1gG FC variant, and the domprises two or more amino acids selected from glycine, serine, alanies of human 1gG variant comprises a hinge, CR3, and CR3 domains of human 1gG variant comprises a hinge, CR3, and CR3 domains of human 1gG variant comprises a hinge, CR3, and CR3 domains of human 1gG variant comprises a hinge, CR3, and CR3 domains of human 1gG variant comprises a hinge, CR3, and CR3 domains of human 1gG variant comprises a hinge, CR3, and CR3 domains of human 1gG variant comprises a hinge, CR3, and CR3 domains of human 1gG variant comprises a hinge, CR3, and CR3 domains of human 1gG variant comprises a hinge, CR3, and CR3 domains of human 1gG variant comprises a hinge, CR3, and CR3 domains of human 1gG variant comprises a hinge, CR3, canded the human 1gG variant comprises a hinge, CR3, canded the human 1gG variant comprises a hinge cR3, domains of human 1gG variant comprises a hinge cR3, domains of human 1gG variant comprises a hinge cR3, domains of human 1gG variant comprises a linge critical manual activity similar to or higher than protein comprises generating a CR0-derived cell line variant comprises generating a CR0-derived cell line variant comprises generating a CR0-derived cell line variant comprises generating a CR0-derived cell line variant comprises generating a CR0-derived cell line variant comprises generating a CR0-derived cell line variant comprises generating a CR0-derived cell line varian New recombinant HuEPO-L-vFc fusion protein comprises human erythropoietin (HuEPO), a peptide linker, and a human IgG Fc variant, useful for treating chronic anemia due to renal diseases, cancer chemotherapy, or rheumatoid arthritis. Claim 3; SEQ ID NO 18; 31pp; English.

ö
and incorporates a BamHI site. The resulting DNA fragments of approximately 600 bp were inserted into a holding vector such as pUC19 at the HindIII and BamHI sites to give the pBPO plasmid. The sequence of the human EPO gene was confirmed by DNA sequencing.
                                                                                                                                                                            221 APPVAGPSVFLFPPKPKDTLMISRTPEVTCVVVDVSHEDPEVQFNWYVDGVEVHNAKTKP 280
